## Interpreting the Hidden Stress Screening Test

A word of caution: This test is too short to provide more than a screen for hidden stresses. It will not detect all the stresses capable of causing physical illness nor is it capable of reliable diagnosis. If you have concerns about a score greater than zero on any question, a discussion with a medical or mental health professional would be a good next step.

No score proves or disproves the presence of hidden stress. People with higher scores are more likely to have hidden stresses but even some people with scores in the 2–5 range will have issues they could beneficially review with a health care professional.

Here are a few additional basic suggestions about what to do for scores greater than zero for each question.

Question 1: Make a list of every stress in your life. Keep the list with you and add to it as new ideas come up. Then, see if you can reduce the stress from some of the listed items.

Question 2: If possible, take several hours each week for self-indulgence to put yourself on the list of people for whom you care.

Question 3 A & B: These two questions screen for the presence of an Anxiety Disorder. Ask your health care professional for more information.

Question 3 C & D: These two questions screen for the presence of Depression. Ask your health care professional for more information.

Questions 4 & 5: These two questions screen for the presence of Post-Traumatic Stress Disorder. Ask your health care professional for more information.

Question 6: Significant scores here raise the possibility of your having prolonged effects of childhood stress. This can cause other types of hidden stresses described above and can also lead to one or more of the following:

- Low self-esteem
- Addictions (tobacco, alcohol, drugs, work, sex, eating, gambling, exercise, shopping)
- Eating disorders
- Regularly finding yourself in relationships where you are treated disrespectfully
- Cutting, burning or otherwise deliberately injuring yourself

If any of these issues is a concern, ask your health care professional about them.
